Homework #4 WebSocket

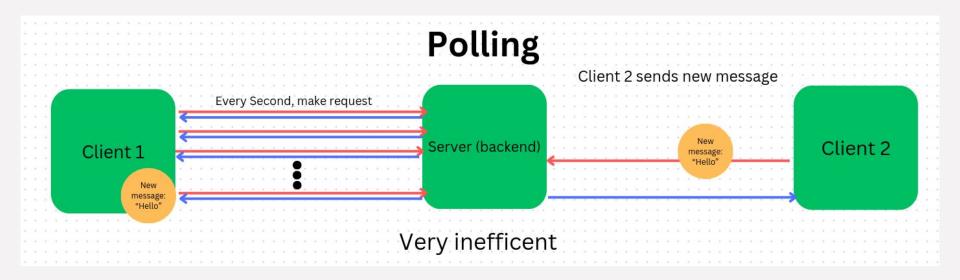

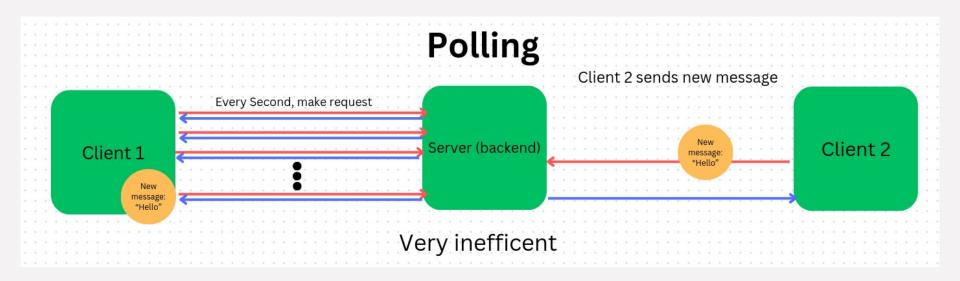

- Websocket Handshake
- Parse frames
- Echo
- Drawing Board
- DMs
- WebRTC

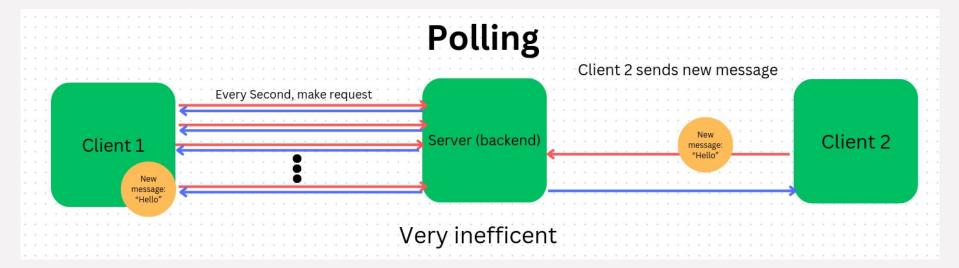

Http works on the idea of request and responses. But client that wants information has to request (has to ask for it first)

What if we have chat feature where we want information to be sent to client even when it doesn't ask for it. This is what your homework does

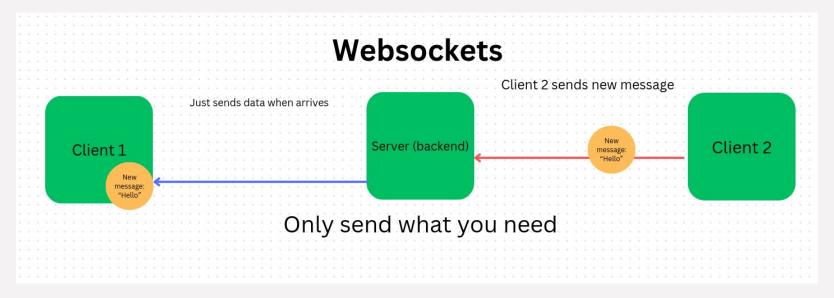

Why can't the sever just send a update right away. That is just what http is limited to, server is not allowed to send events to client

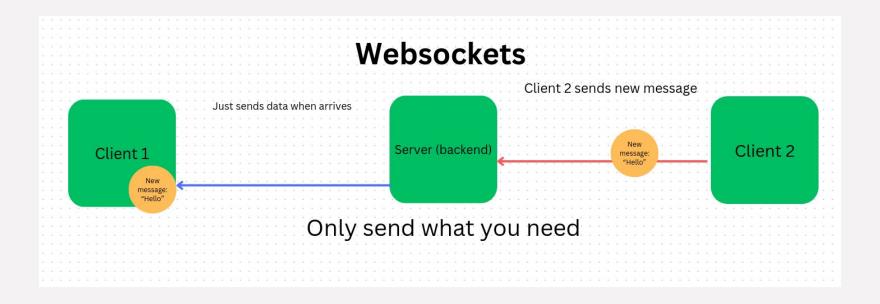

Can have massive overhead with something like twitch, having all these users requesting messages.

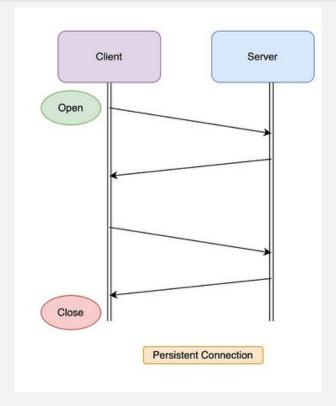

- Estimated \$4-6 million a month to run twitch, 2.4 million average viewers
- Only want to have exactly as many requests as needed

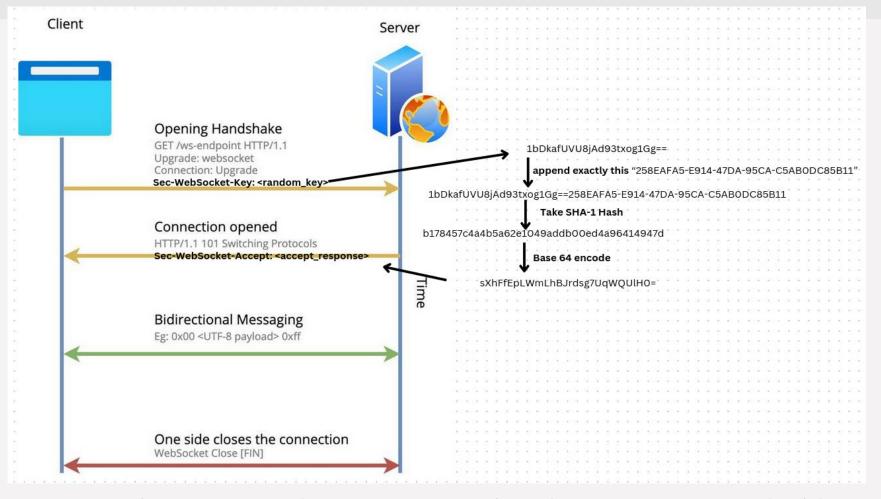

To solve this, we use websockets

This works because websockets and HTTP both use TCP. TCP allows for bidirectonal communication, websockets takes advantage of that.

HTTP closes right away
Get your data (html, css, js) then it closes TCP connection

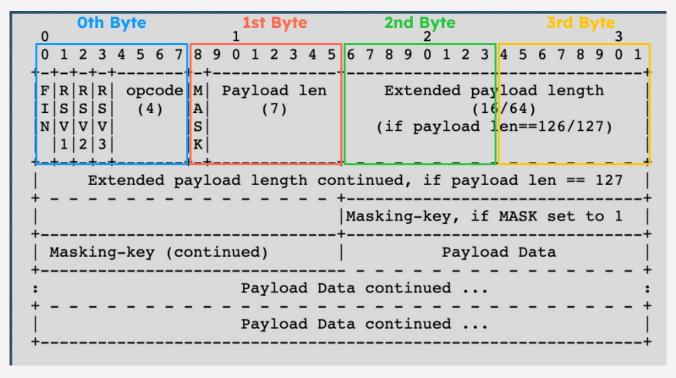

Not going to close the TCP connection the user requested with

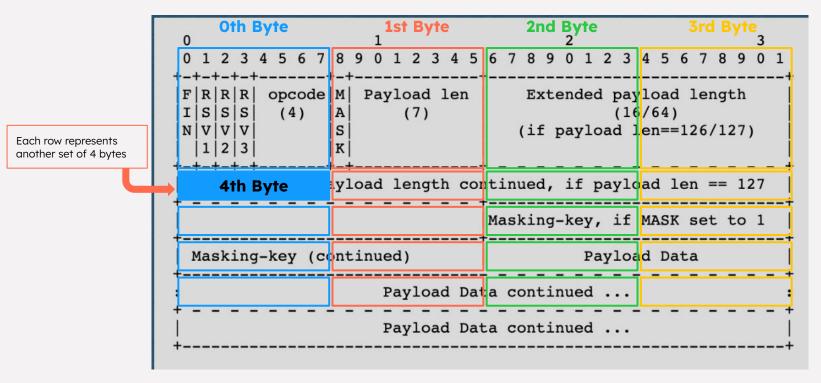

```
opcode M Payload len
                                    Extended payload length
                                             (16/64)
          (4)
               A
                       (7)
NVVV
                                   (if payload len==126/127)
    Extended payload length continued, if payload len == 127
                                Masking-key, if MASK set to 1
                                         Payload Data
 Masking-key (continued)
                     Payload Data continued ...
                     Payload Data continued ...
```

Then all from there on this bidirectional connection sends frames.

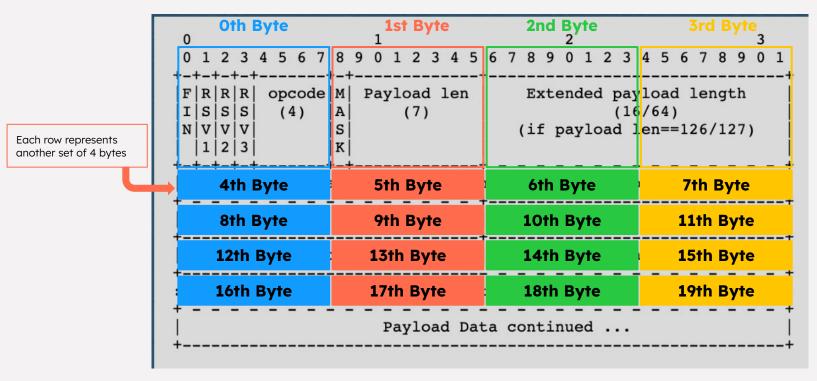

ALL IN BITS

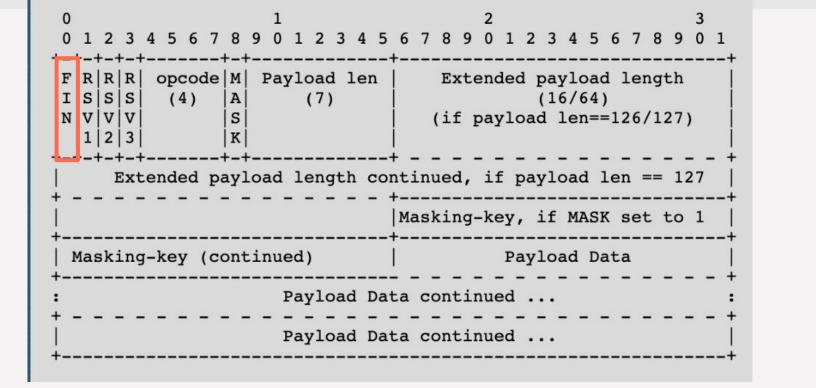

The diagram from the <u>websockets rfc</u> numbers represent each **bit** not byte (Each row **32 bits** or **4 bytes**)

The diagram from the <u>websockets rfc</u> numbers represent each **bit** not byte (Each row **32 bits** or **4 bytes**)

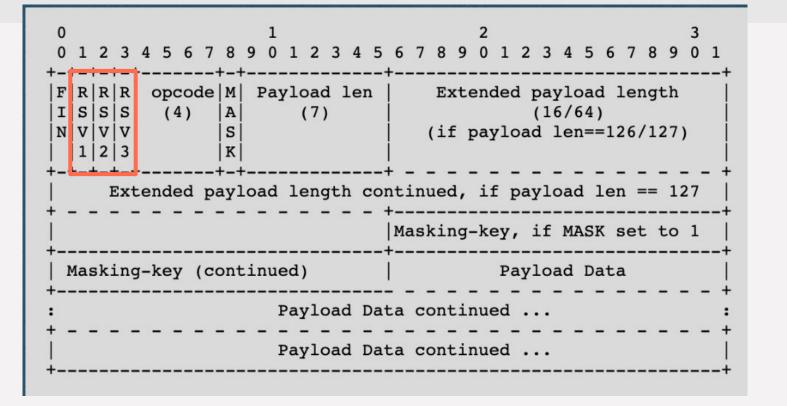

The diagram from the <u>websockets rfc</u> numbers represent each **bit** not byte (Each row **32 bits** or **4 bytes**)

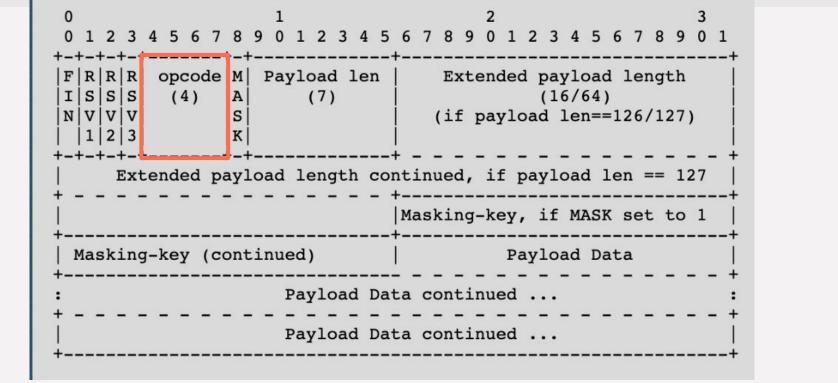

FIN: The finish bit

1 - This is the last frame for this message0 - There will be continuation frames containing more data for the same message

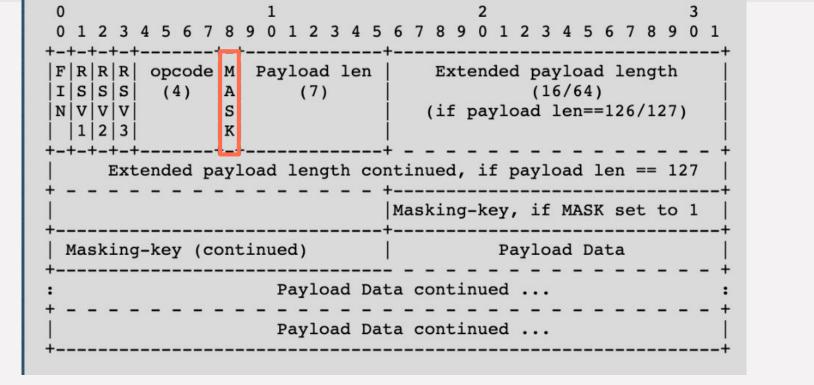

RSV: Reserved bits

Used to specify any extensions being used [You can assume these are always 000 for the HW]

Opcode: Operation code

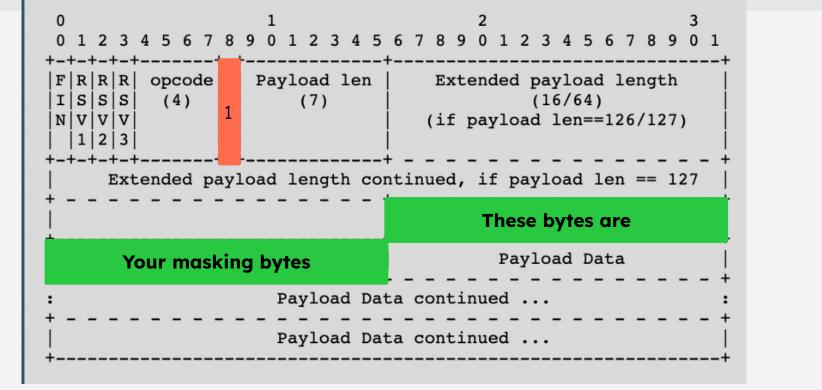

Specifies the type of information contained in the payload Ex: 0001 for text, 0010 for binary, 1000 to close the connection, 0000 for continuation frame

MASK: Mask bit

Set to 1 if a mask is being used

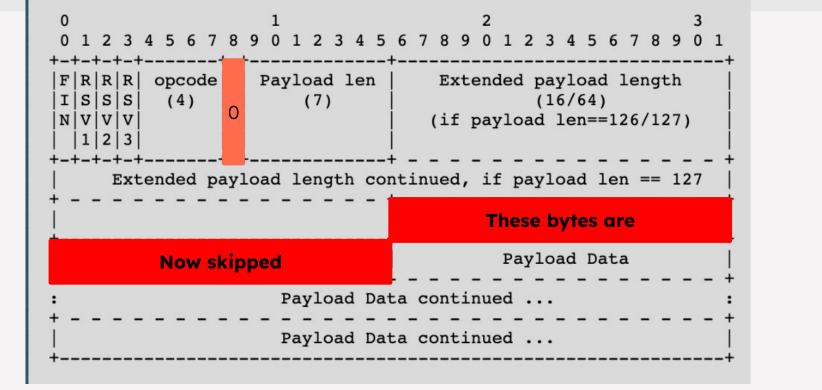

- Set to 0 if no mask is being used
- This will be 1 when receiving messages from a client

MASK: Mask bit

Set to 1 if a mask is being used

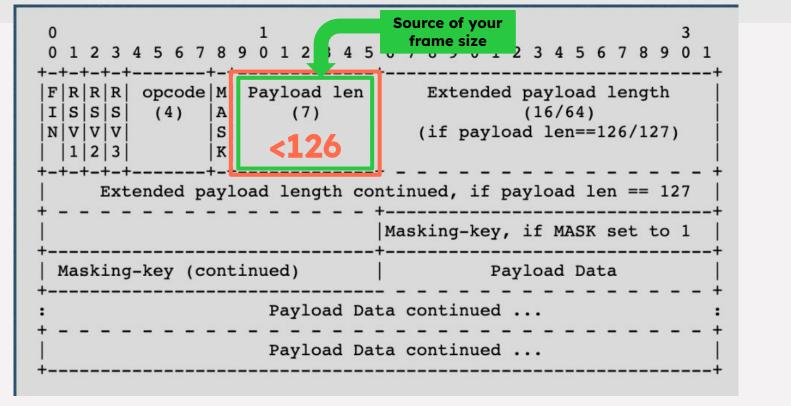

- Set to 0 if no mask is being used
- This will be 1 when receiving messages from a client

MASK: Mask bit

Set to 1 if a mask is being used

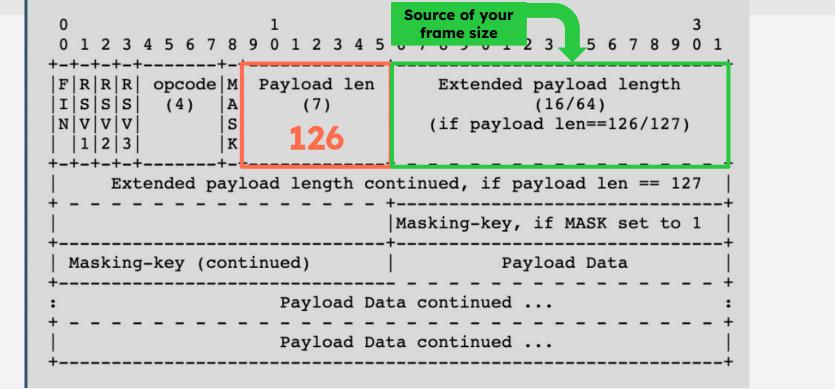

- Set to 0 if no mask is being used
- This will be 1 when receiving messages from a client

Payload (Frame) Length

If the length is <126 bytes

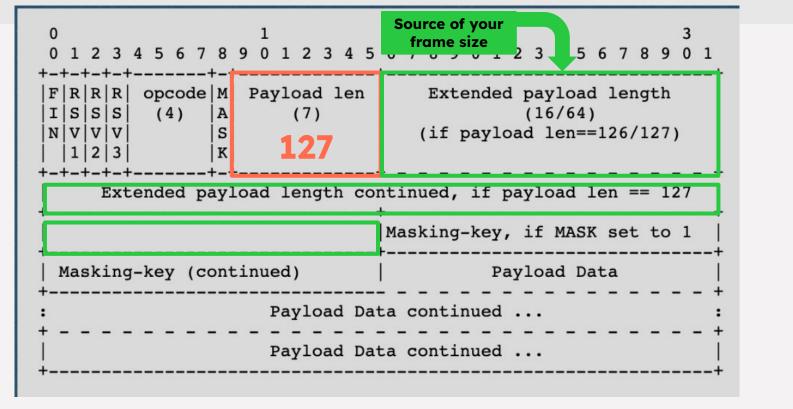

- The length is represented in 7 bits, sharing a byte with the MASK bit
- The next bit after the length is either the mask or payload

Payload (Frame) Length

If the length is >=126 and <65536 bytes

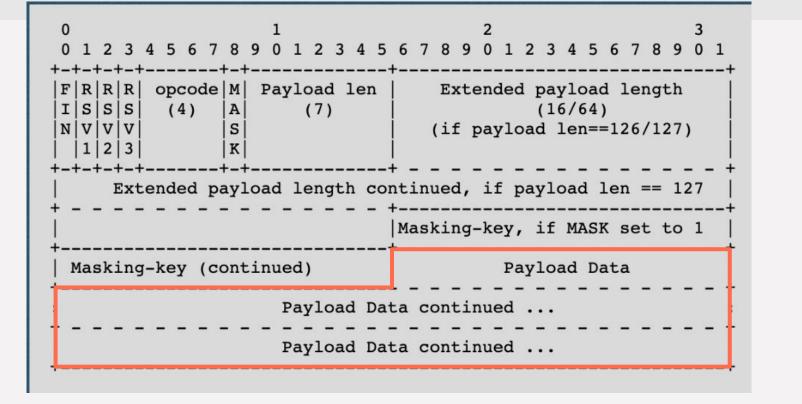

- The 7 bit length will be exactly 126 (1111110)
- The next 16 bits (2 byte) represents the payload length

Payload (Frame) Length

If the length is >=65536 bytes

- The 7 bit length will be exactly 127 (1111111)
- The next 64 bits (8 bytes) represents the payload length

The Payload

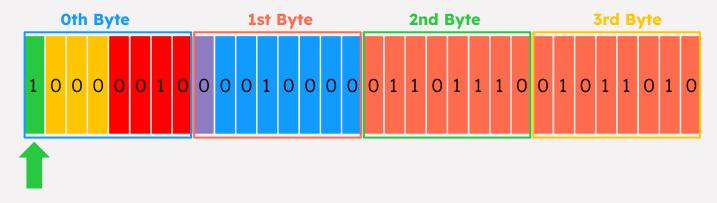

The data you are trying to send in bytes

• If there is a mask, every 4 bytes will be XOR'd with the 4 bytes of the mask to get true payload

Examples

0 1 0 1 2 3 4 5 6 7 8 9 0 +-+-+-+	+		
F R R opcode M Payload len Extended payload length			
Extended payload length continued, if payload len == 127			
Masking-key (continued) Payload Data			
: Payload Data continued :			
Payload Data continued			

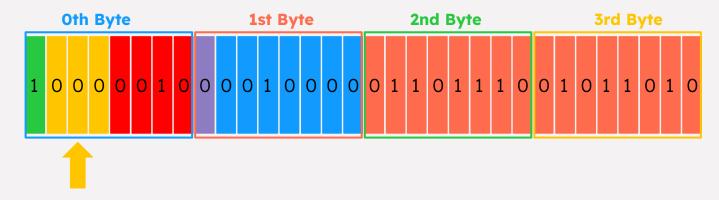

Example #1

FIN: The finish bit

• 1 - This is the last frame for this message

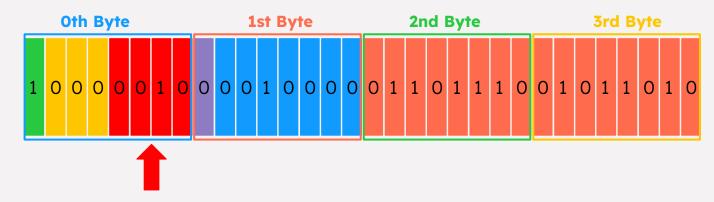

Example #1

RSV: Reserved bits

• [You can assume these are always 000 for the HW]

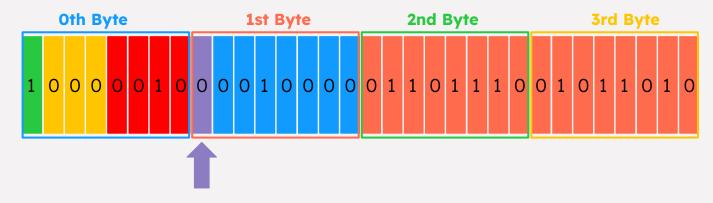

Example #1

opcode: Operation code

• 0010 for binary

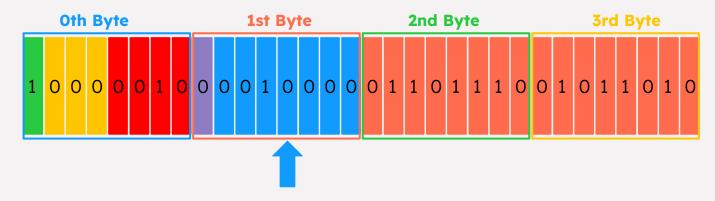

Example #1

MASK: Mask bit

Set to 0 no mask is being used

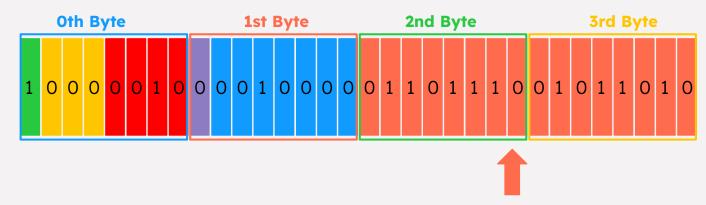

Example #1

Payload (Frame) Length

• Length of 16 (0010000)

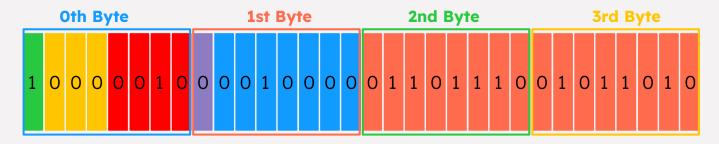

Example #1

The Payload

• Its two bytes of binary data 16

Example #1

FIN: The finish bit - 1

RSV: Reserved bits - 000

opcode: Operation code - 0010 for binary

MASK: Mask bit - Set to 0 no mask is being used

Payload (Frame) Length - Length of 16 (0010000)

The Payload - Its two bytes of binary data 16

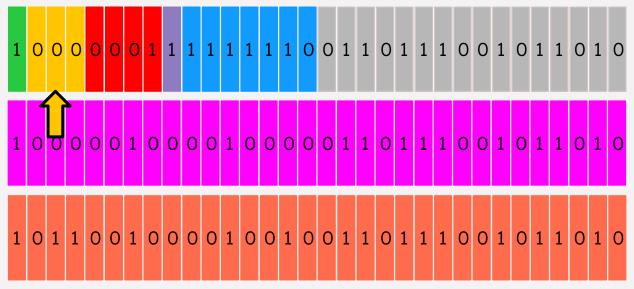

Example #2

FIN: The finish bit

• 1 - This is the last frame for this message

Example #2

RSV: Reserved bits

• [You can assume these are always 000 for the HW]

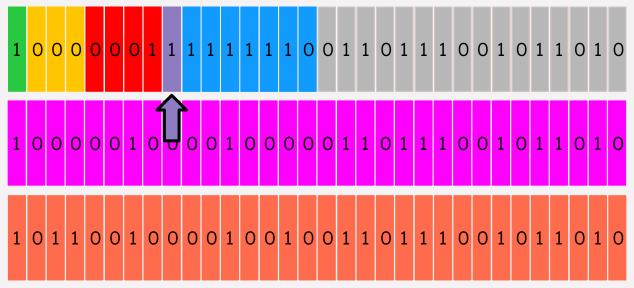

Example #2

opcode: Operation code

• 0001 for text

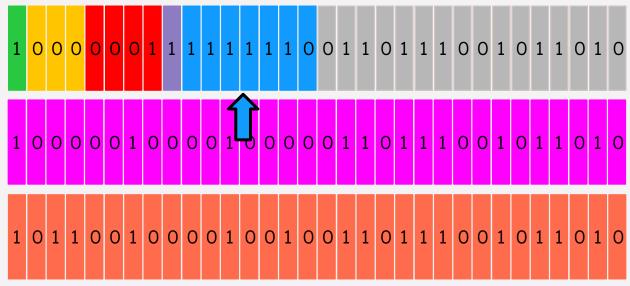

Example #2

MASK: Mask bit

Set to 1 mask is being used

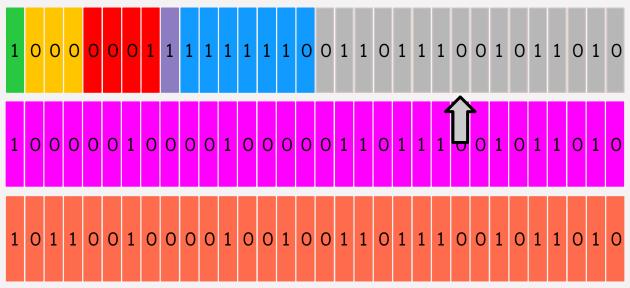

Example #2

Payload (Frame) Length

- The 7 bit length is exactly 126 (1111110)
- length is >=126 and <65536 bytes

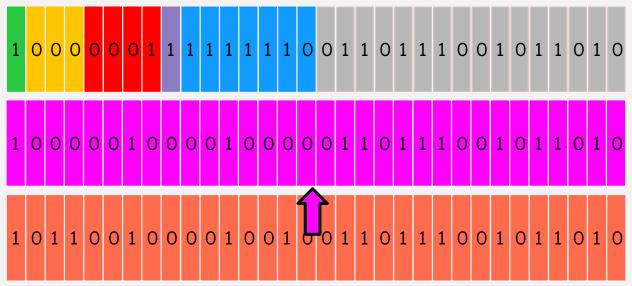

Example #2

Extended Payload (Frame) Length

• Length is, 28250

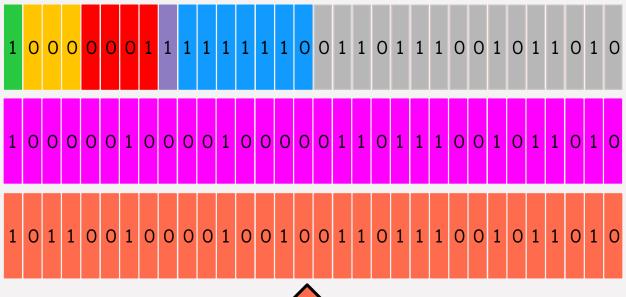

Example #2

MASK

This is the mask that will XOR with payload

Example #2

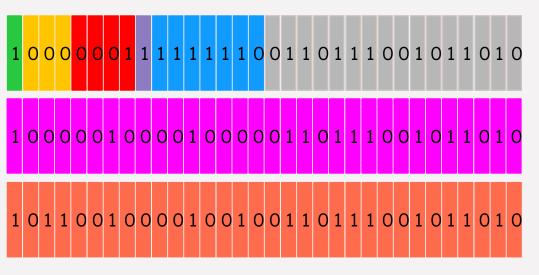

The Payload

• Only first 32 bits of 28250, would continue on

Example #2

FIN: The finish bit - 1 RSV: Reserved bits - 000 opcode: Operation code -0010 for text MASK: Mask bit - Set to 1 mask is being used Payload Length - 126 **Extended Payload (Frame)** Length - Length of 28250 MASK - will XOR with payload The Payload - 28250 bits of data
