Encodings

Sending Data

- The Internet can only transfer bits
 - Copper: High/Low voltage
 - Fiber: Light/Dark
- All data sent must be binary

How do we send text as binary data?

ASCII

- Character encoding
 - Maps numbers to characters
 - Numbers represented in bits
 - Bit are sent through the Internet
- ASCII uses 7 bit encodings

For headers: Only ASCII is guaranteed to be decoded properly

ASCII

- As a String:
 - "hello"
 - Language specific representation
- In Hex:
 - 68 65 6c 6c 6f
 - Need to encode the String into a byte representation
- In Binary:

 - Send this over the Internet

Character Encodings

- ASCII can only encode 128 different characters
 - Decent for english text
 - Unusable for languages with different alphabets
- With the Internet, the world became much more connected
 - Too restrictive for each alphabet to have its own encoding
- How do we encode more characters with a single standard?
 - We need more bits
 - UTF-8 to the rescue

UTF-8

- The modern standard
- Uses up to 4 bytes to represent a character
- If the first bit is a 0
 - One byte used. Remaining 7 bits is ASCII
 - All ASCII encoded Strings are valid UTF-8

Number of bytes	Bits for code point	First code point	Last code point	Byte 1	Byte 2	Byte 3	Byte 4
1	7	U+0000	U+007F	0xxxxxxx			
2	11	U+0080	U+07FF	110xxxxx	10xxxxxx		
3	16	U+0800	U+FFFF	1110xxxx	10xxxxxx	10xxxxxx	
4	21	U+10000	U+10FFFF	11110xxx	10xxxxxx	10xxxxxx	10xxxxxx

Source: Wikipedia

UTF-8

- If more bytes are needed:
 - Lead with 1's to indicate the number of bytes
 - Each continuation byte begins with 10
 - Prevents decoding errors
 - No character is a subsequence of another character

Number of bytes	Bits for code point	First code point	Last code point	Byte 1	Byte 2	Byte 3	Byte 4	
1	7	U+0000	U+007F	0xxxxxxx				
2	11	U+0080	U+07FF	110xxxxx	10xxxxxx			
3	16	U+0800	U+FFFF	1110xxxx	10xxxxxx	10xxxxxx		
4	21	U+10000	U+10FFFF	11110xxx	10xxxxxx	10xxxxxx	10xxxxxx

Sending Data

- When sending Strings over the Internet
 - Always convert to bytes before sending
 - Encode the String using UTF-8
 - The Internet does not understand language-specific Strings

- When receiving text over the Internet
 - It must have been sent as bytes
 - Must convert to a language-specific String
 - Decode the bytes using the proper encoding

Content Length

- Content-Length header must be set when there is a body to a response/request
- Value is the number of bytes contained in the body
 - Bytes referred to as octets in some documentation

- If all your characters are ASCII
 - Can get away with using the length of the String
- Any non-ASCII UTF-8 character uses >1 byte
 - Cannot use the length of the String!

Content Length

- To compute the content length of a UTF-8 String
 - Convert to bytes first
 - Get the length of the byte array

What about non-text data?

Sending Images

- Sometimes we want to send data that is not text
- Use different formats depending on the data

- To send an image
 - Read the bytes from the file
 - Send the bytes as-is
 - Content-Length is the size of the file

Content Type

- When sending different types of content
 - Use the Content-Type header to tell the browser how to read the response
- Content type contains the type of content as well as the encoding

- Example Sending your HTML in UTF-8
 - Content-Type: text/html; charset=UTF-8

MIME Types

- The first value of the content type is the MIME type
 - Multipurpose Internet Mail Extensions
 - Developed for email and adopted for HTTP
- Two parts separate by a /
 - <type>/<subtype>
- Common types
 - text Data using a text encoding (eg. UTF-8)
 - image Raw binary of an image file
 - video Raw binary of a video

MIME Types

- Common Type/Subtypes
 - text/plain
 - text/html
 - text/css
 - text/javascript
 - image/png
 - image/jpeg
 - video/mp4

MIME Type Sniffing

- Modern browsers will "sniff" the proper MIME type of a response
 - If the MIME type is not correct, the browser will "figure it out" and guess what type makes the most sense
- Browsers can sometimes be wrong
 - Surprises when your site doesn't work with certain versions of certain browsers
- Best practice to disable sniffing
- Set this HTTP header to tell the browser you set the correct MIME type
 - X-Content-Type-Options: nosniff

MIME Type Sniffing

• Security concern:

- You have a site where users can upload images
- All users can view these images
- Instead of an image, a user uploads JavaScript that steals personal data
- You set the MIME type to image/png
- The browser notices something is wrong and sniffs out the MIME type of text/javascript and runs the script
- You just got hacked!
- Solution:
 - X-Content-Type-Options: nosniff
